## Search Notes

Attached are the search results for the method for simulating testing of a missile.

Also attached is a search feedback form. Completion of the form is voluntary. Your completing this form would help us improve our search services.

I hope the attached information is useful. Please feel free to contact me if you have any questions or need additional searching on this application.

# STIC Search Results Feedback Form

**EIC 3700**

Questions about the scope or the results of the search? Contact *the EIC searcher or contact:*

**John Sims, EIC 3700 Team Leader**  
RND 8B35, Phone 2-3507

## Voluntary Results Feedback Form

➤ I am an examiner in Workgroup:  Example: 3730

➤ Relevant prior art **found**, search results used as follows:

- ☐ 102 rejection
- ☐ 103 rejection
- ☐ Cited as being of interest.
- ☐ Helped examiner better understand the invention.
- ☐ Helped examiner better understand the state of the art in their technology.

Types of relevant prior art found:

- ☐ Foreign Patent(s)
- ☐ Non-Patent Literature  
(journal articles, conference proceedings, new product announcements etc.)

➤ Relevant prior art **not found**:

- ☐ Results verified the lack of relevant prior art (helped determine patentability).
- ☐ Results were not useful in determining patentability or understanding the invention.

**Comments:**

**Drop off or send completed forms to STIC/EIC3700 RND 8B31**

Abstract (Basic): WO 9960326 A1

NOVELTY - The missile simulator measures the control loop's trouble signal, generates an actual value for position of the target seeker and outputs the actual value to weapon system. Based on an output value, a new trouble signal is then calculated.

DETAILED DESCRIPTION - The missile simulator used consists of a weapon system (1), where the missile is controlled by the system by a trouble signal (6) generated in a control loop. Based on this signal, a target seeker is positioned and the positional information of target seeker is sent to system via actual value signal (8).

USE - For missile simulation during testing of an aircraft system.

ADVANTAGE - Permits continuous measurement of the command signal in the aircraft system.

DESCRIPTION OF DRAWING(S) - The figure shows the schematic diagram of the weapon system of aircraft.

Weapon system (1)

English Abstract

A method for simulating an actual missile, by means of a missile simulator, aircraft system which comprises a weapons system (1), where the missile is controlled from the weapons system (1) by a error signal (6) in a control loop by means of the said error signal (6) positioning a target seeker in the missile and through the sending back of the target seeker's position to the weapons system via an actual value signal (8), where a) the target seeker in the missile is commanded by the weapons system (1) to adopt a predetermined position, b) the missile simulator measures the control loop's error signal (6), generates an actual value for the position of the target seeker and sends the actual value (8) to the weapons system (1), c) the weapons system (1) calculates a new error signal (6) for the control loop and where d) steps b to c are repeated during the test. By using the method, an actual missile is not needed during the testing.

Abstract: The implementation of military **aircraft** pilot behavior with a parameterized set of rules is seen to be an effective way to represent a vast array of alternative behaviors. It can easily be set to mimic the behavior of human operators over a limited domain. In addition, any knowledge obtained during the evolutionary adaptation can be readily extracted from the new **control** parameter **values**. The genetic algorithm is seen to be an effective method for evolving a population of trial **control** parameters in a continuous search for better-adapted behaviors in a complex, dynamic environment. The use of an internal **simulation** is seen to be a practical way to represent knowledge about the external world. The adaptive pilot model was able to generate behaviors that were significantly better than those of preprogrammed models. Like the human pilot it emulates, the pilot model can adapt its behavior when faced with novel threats and, thus, significantly reduce the fraction of **missiles** that leak through. (5 Refs)

Abstract: The Foxtrot **System** is an infra-red (IR) **simulator** that is mounted in a pod under the wing of a **test aircraft**. It uses a gimbal **control system** that points and stabilizes an IR camera. The video **signal** from this camera is sent to an image processor that analyzes the **signal** in order to detect features of interest in a scene and then make tracking decisions for the gimbal **system**. The gimbal **system** has evolved from an analog linear prototype **system** controlled by an eight (8) bit microprocessor to the present VME bus based **system** (allows the migration of **control loop** functions from the hardware to the software domain) that is **controlled** by a real time operating **system**. Starting with the premise that some key **systems** components are now and are expected to remain analog in nature (i.e. Inertial Gyro and Servo Motor), this paper discusses the evolution of Foxtrot's gimbal **system** architecture that is taking place in order to accommodate both these required analog interfaces and advances in software and hardware technology (i.e. improved compilers, real time operating **systems**, improved processors, enhanced image processing hardware). Discussion then focuses on improvements that can be made to the **system** by mathematically modeling it on a software **simulator** such as MATLAB. The response of the **system** can then be described as a difference equation and the emerging capabilities of Digital **Signal** Processing (DSP) can be utilized to improve **system** performance. The vertical channel of an inertial **system** is unstable. This instability is caused by the gravity compensation fed back to the vertical accelerometer output. The gravity compensation, computed as a function of altitude after doubly integrating the output of that accelerometer, creates an unstable, positive **feedback loop**. The time constant of this instability is about 560 seconds near the earth's surface. For ballistic **missiles** and rockets this does not pose a problem because the **guidance** is completed before the instability becomes serious. For **aircraft systems**, however, one must augment the inertial measurements, typically with barometric altimeter information, in order to stabilize the vertical inertial channel. Earliest mechanizations of the baro-inertial **loop** employed second-order **feedback** with constant gains. The next step was to add integral **feedback** in order to bias the vertical accelerometer, thus creating a third-order **system**. Widnall and Sinha investigated the third-order **loop** to find the optimum set of fixed gains. Not surprisingly, they found that the optimum set of gains depended on the **values** assumed for the noise characteristics of the accelerometer and the barometric altimeter. Because the noise magnitudes will vary as a function of the **aircraft**'s flight regime, the baro-inertial **feedback** gains should not be constant, but should also vary. Litton first mechanized a third-order variable gain baro-inertial **loop** in CLASS, in all-weather close air support **system**, successfully demonstrated in 1972. They gradually improved upon that basic design over the years as successive **systems**, principally ARIS, uncovered more and more barometric altitude error characteristics which had to be accommodated. The culmination of this evolutionary development is the baro-inertial **loop** currently mechanized in the LN-93 and LN-94 **systems** for the USAF Standard RLG INU. Following a discussion of barometric and inertial errors, we will take a detailed look at the LN-93/94 conventional vertical channel mechanization, the reasons behind the **loop** design, and some **simulation** results illustrating the **loop** performance when subjected to certain flight maneuvers and barometric errors.

This report describes **simulations** and field **tests** performed with the two digital processing **systems**, DP1 and DP2, which were built on the Digital Guided **Weapons Technology** Program. The DP1 **system** was integrated with a GFE Inertial Measurement Unit (IMU); and, after **testing** at Hughes **Aircraft** Company, it was integrated with the Completely Integrated Reference Instrumentation **System** (CIRIS) at the central Inertial **Guidance Test** Facility (CIGTF), Holloman Air Force Base, New Mexico. Performance **tests** were carried out by the Air Force in the laboratory, in a van, and in an **aircraft**. Performance in navigation accuracy relative to CIRIS was determined. The DP2 **system** was integrated into a semiphysical hybrid computer **simulation** at the contractor facility. The **simulation** performed was that of a long-range air-to-surface **weapon** which uses an aided inertial **guidance system** for midcourse **guidance**. A **simulated** LORAN sensor was used to update the inertial navigation subsystem. The DP2 software included Management and Executive Software and the following computational elements: LORAN processing, alignment filter midcourse **guidance** law, navigation, and flight **control**. This report presents the results of the second phase of a study to  
investigate the feasibility of a modular digital **guidance system** for  
Navy **air-to-air missile** applications. The studies involved the analysis  
of functions for digital implementation in all classes of **air-to-air**  
**missiles** and the derivation of computer requirements in terms of  
throughput memory, architectural features, modularity and compatible  
software characteristics. The functions of: **target seeker head control**,  
estimation, **guidance** and autopilot were addressed in the first study phase  
and those of **seeker signal processing**, fuzing, telemetry, **test** and flight  
phase/mode **control** were analyzed in the second study phase reported herein.  
In addition, **simulation** analyses of estimation, **guidance** and autopilot  
algorithms were performed to determine performance improvement as a  
function of complexity. In summary, the studies have shown that modular  
digital **guidance** and **control** is both feasible and effective in improving  
**missile** performance and flexibility to counteract changing threat  
situations and advancing technology.

The compatibility of a representative 500 pound weight boost-glide **air-to-ground missile** with the trajectory constraints imposed by a Synthetic Aperture Radar - Retransmission **guidance system** was investigated using a digital flight **simulation**. A demonstration flight profile was assumed, with a minimum of 20 seconds of tracking on the **aircraft -to-target** line of sight required. A **guidance** algorithm was developed which produced satisfactory trajectories. A first order gradient technique was employed in an unsuccessful attempt to optimize the trajectories for maximum range. A useable **launch** envelope for this **missile** was determined. The azimuthal extent of the envelope was limited by radar **system** constraints to 15 deg-90 deg from the **aircraft** velocity vector. A maximum slant range of 21 nautical miles was obtained from a **launch** altitude of 35,000 ft. Range deteriorated rapidly with decreasing **launch** altitude, with 5,000 ft being the lowest altitude at which a useable **launch** envelope was obtained. Maximum slant range at 5,000 ft **launch** altitude was 5.5 nautical miles. (Author)

These proceedings contain papers included in the Tenth Biennial **Guidance Test** Symposium. This symposium, hosted by the Central Inertial **Guidance Test** Facility, is directed toward the exchange of information, stimulation of new ideas, and discussion of recent developments in the field of **guidance testing**. The papers presented include such topics as the use of the Global **Positioning System**, **Aircraft** Inertial Navigators, Component Evaluation, Advanced **Guidance** Methodology, **Missile Guidance Systems**, and Analysis Techniques. The included papers are those presented in the unclassified sessions of the symposium. Papers presented in the classified portions of the meeting are being published as Volume II. (Author)

Abstract: The **signal** emitted by a radar transmitter also serves to identify the existence and **position** of the radar and can be received by a direction-finding RF sensor. This sensor can then be used as the basis for the **guidance system** of a precision guided munition (PGM), which is designed to home on the source of the radar emissions to deliver a warhead at the radar site. Such a scheme of PMG delivery provides an excellent 'fire-and-forget' offensive capability for **aircraft** intent on gaining **control** of a particular **airspace**. Predicted accuracy data of monopulse direction finding for a passive RF sensor can be used as a basis for generating an error model for sensor performance **simulations**. This paper contains a brief description of the **simulation** model used in the investigation, which is followed by a description of the **target** and PGM scenarios investigated. A summary of the results obtained is followed by the conclusions which are supported by the results. (4 Refs)

The **Airborne Seeker Test Bed** is a recently operational instrumentation system containing a closed-loop tracking, semi-active seeker with the capability to record high-fidelity signals pertaining to radar seeder phenomenology, target scattering characteristics, electronic countermeasures, and acquisition and tracking performance. The unique capabilities of the test bed will be used to collect data and develop computer models for evaluating and predicting missile performance. Test bed data will be used to evaluate the susceptibility of U.S. aircraft to missile attack, and to explore new directions for future systems. The test bed is also designed to support the development of advanced seekers and new electronic counter-countermeasure techniques, and to demonstrate their capabilities in flight. Keywords: Closed-looped tracking, Semi-active seeker, Counter-countermeasure. (RWJ)

As **guidance** and **control systems** have become more complex, the role of computers in their design and development has become increasingly important. The results of **simulation** have been presented regularly in **guidance** and **control** symposia and, to a lesser extent, the use of computer

design aids. However, it is considered that a symposium dedicated to computer aided design and **simulation** will provide a valuable opportunity to highlight the possibilities, the problems and solutions in this important field. Computer aided design and **simulation** find applications at all stages of a project's life, starting with the conceptual design phase in which a basic **system** is defined and its performance evaluated using standard or special purpose design aid tools and **simulation** software. In the subsequent development of the **system** the effects of individual components or **subsystems** such as filters, limiters and other non-linearities, sensor and actuator dynamics, and embedded computer algorithms, are progressively quantified. In the later stages of development and evaluation, the complete **system** is **simulated** in sufficient detail to verify **system** performance against specifications. As **system** development proceeds, increased emphasis is placed on real time computer **simulation**, with some or all of the hardware included in the **simulation**, depending on the phase of the project. Hardware-in-the-loop **simulation** includes the special case in which a human operator is included. The **air** of the symposium was to cover all stages of the development process. Keywords: French language, NATO furnished, **Missile** applications, **Aircraft** applications, Pilot in the loop **simulations**.

This volume formulates an error model for analyzing a cooperative engagement cruise **missile** defense scenario in which a surveillance platform transmits the location of a **target** to an **air** interceptor **missile** only once, just prior to **launch**. Included in this model is a description of

the three relevant inertial navigation systems (aboard the surveillance platform, the launch platform, and the missile), the guidance system of the missile, the surveillance platform radar, and the motion of the target. Detailed equations for each of these components are provided along with numerical values for the error parameters assumed for the various instruments.

Language: English Document Type: Conference Paper (PA); Journal Paper (JP)

Treatment: Practical (P)  
Abstract: Astroinertial navigation and guidance systems use star sensors to provide attitude correction information to the inertial system. Aircraft astroinertial navigation and ballistic missile astroinertial guidance present unique design challenges that prompted the development of a computer-based simulation tool. Star sensing from aircraft must be done during daylight when sky radiance causes a background fifty or more times larger than the star signal. Star sensing for spacecraft and ballistic missile guidance may be done in the presence of a high radiation environment that generates significant background noise. The presence of this high background noise complicates star sensor design. A star sensor simulator has been developed and applied to preliminary design issues. The simulator models characteristics of the star, background, windows, telescope, detector, electronics, and environment. Simulation generates data similar to that received from a real star sensor. The simulated data is then processed to reveal star sensing capability. Requirements, models, simulator design, and representative simulations are presented. (0 Refs)

A **target seeker simulator** has been successfully developed that, when installed in an AN/BQM-34A drone, **simulates** an active homing cruise **missile**. In order to **simulate** realistically a cruise **missile** illuminating and homing on a **target**, it was necessary to keep the **seeker** antenna pointed at the **target** regardless of the drone movement. Pointing of the **seeker** antenna is accomplished on the basis of **signals** received from an associated beacon at the **target** site. Flight **tests** conducted at the White Sands **Missile Range** (WSMR) in September 1975 produced satisfactory operational performance by the **target seeker simulator**. (Author)

NAVY SUCCESSFULLY **TEST FIRES HARM MISSILE**

Defense Week, v12, n3, pN/A

Jan 14, 1991

TEXT:

The Navy has successfully **test** fired a HARM anti-radiation **missile** equipped with a new low cost **target seeker** produced by the Loral Corp.

The **missile** was fired Dec. 20 from a Navy F/A-18 **aircraft** against **simulated** enemy radar.

The **seeker** is the product of a 1985 development contract. Loral Aeronutronic is currently under a \$21.4 million contract to produce 100 **seekers**.

Successful firing of Sidewinder from Apache  
Jane's Defence Weekly, v8, n24, p1407  
Dec 19, 1987  
Language: English Record Type: Abstract  
Document Type: Magazine/Journal; Trade

ABSTRACT:

Two AIM-9 Sidewinder **missiles** were successfully fired from an A-64A Apache attack helicopter in **tests** conducted at US White Sands **Missile** Range. The **tests** are designed to evaluate the **air-to-air** combat capabilities of the Apache deploying various **weapons**. The Sidewinder **tests** examined **missile** separation and **target seeking /weapons control** compatibility...

Research & development: AH-64 **missile** firing **tests**  
Interavia **Air** Letter December 23, 1987 p. 5  
ISSN: 0020-5176

McDonnell Douglas (US) has successfully fired 2 AIM-9 Sidewinder **air-to-air missiles** from a AH-64A Apache attack helicopter, as part of programme to determine Apache **air...**

...capabilities. The programme is due to end in 8/88. The objectives of the Sidewinder **test** were to evaluate **missile** separation and the ability of the **missile 's target seeking system** to interface with the AH-64A's **weapons control system**. The programme also includes **tests** of Stinger and Mistral **missiles** .

Designated States (Regional): CH DE FR GB LI

Abstract (Basic): EP 1306641 A2

NOVELTY - A pre-launch module (10) generates **missile** interface response **signals** including a **missile** release **signal** adapter in response to **control signals** from a fire control **system**, for **simulating** release of **missile**. An umbilical cable provides data communication channel for information exchange between the module and the **control system** by coded **signals** for **testing missile** interface.

DETAILED DESCRIPTION - INDEPENDENT CLAIMS are also included for the following:

- (1) a pilot training apparatus; and
- (2) an apparatus for training load crew, ground crew and pilots in loading, **testing** and launching of **missiles**.

USE - For **simulating** pre-launch functions of **aircraft missile system**.

ADVANTAGE - The apparatus is compatible with most types of **aircrafts**.

DESCRIPTION OF DRAWING(S) - The figure shows a block diagram of the **missile simulation** apparatus.

pre-launch module (10)  
MIL-STD-1553B circuitry (12)  
pp; 14 DwgNo 6/7

Technology Focus:

TECHNOLOGY FOCUS - INDUSTRIAL STANDARDS - The pre-launch module  
complies with MIL-STD-1553B standard.

Patent No	Kind	Lan	Pg	Main IPC	Filing Notes
US 5624264	A		51	F41A-033/00	

Abstract (Basic): US 5624264 A

The **simulator** comprises a number of **signal** conditioning circuits device for receiving power and **control signals** from the **aircraft** on board launcher, which condition the power and **control signals** to provide digital **signals** indicative of the presence or absence of the power and **control signals** , processing device coupled to the number of **signal** conditioning circuit device for receiving and processing the digital **signals** from the **signal** conditioning circuit device, processing device, responsive to the processing of the digital **signals** to generate a number of relay energizing logic **signals**, and relay circuits coupled to the processing device.

Each relay circuit receives one of the relay energising logic **signals** and one of the power **signals**, and each relay circuit is energised by an active state of the relay energizing logic **signals** received, or de-energised by inactive state of the relay energizing logic **signals** received. At least some of the relay circuits are energized during a **simulated** launch of the **missile** to allow the power **signals** to pass through the relay circuits energized to the **missile** to provide power to the **missile** after the **simulated** launch. The remainder of the relay circuits are de-energized during **simulated** launch of the **missile** .

ADVANTAGE - Provides economic means of **testing missile** launch sequence from **aircraft** without **actual** live fire of **missile** from **aircraft** , emulates functions of **missile** 's on board turbo generator

Serial 09/700316

January 25, 2005

by using microprocessor **controlled** relays to provide phase gyro drive **signals** to **missile** gyro during launch when umbilical cord opens, and provides high voltage power to **missile** 's on board electronics after launch using microprocessor **controlled** relays and **missile** launcher filament power to emulate turbo generator's high voltage power **signal**.

Abstract (Basic): EP 685700 A

The appts. includes a housing. A **simulation device simulates** pre-launch functions of a **missile**. The **simulation device** is disposed within the housing and is operative to generate a response to data communications received from an **aircraft fire control system**. An electronic communication device provides an umbilical interface between the **simulation device** and the **aircraft fire control system**.

The pre-launch functions include weapons identification, built-in-**test**, and launch cycle responses. The launch cycle response includes the opening of **missile interlock**.

USE - E.g. for pilot training, ground **test training**, load crew training and **missile interface testing**.

Dwg.6/7

Abstract (Equivalent): US 5591031 A

A **missile simulator** apparatus for use with an **aircraft** having a **fire control system** adapted to generate a plurality of **control signals** and at least one **missile station** including a **missile interface**, the apparatus comprising:

a housing releasably attached to the **aircraft**;

receiving means for receiving said plurality of **control signals** from the **aircraft fire control system**, said receiving means disposed within said housing;

**simulation** means for selectively **simulating** a plurality of **missile interface response signals**, said **simulation** means being disposed within said housing and being operative to generate a response to said plurality of **control signals** received from said **aircraft fire control system**; and

electronic communication means for providing an umbilical interface between said **simulation** means and said **aircraft fire control system**;

whereby the apparatus is operative for **testing the missile interface**.

A **missile simulator** apparatus for an **aircraft** having a **fire control system** adapted to generate a plurality of **control signals** including discrete **signals** and at least one **missile station** having a **missile interface**, the apparatus comprising:

a portable training module operative to generate a response to data communications received from said **fire control system** and including:

(i) a housing;

(ii) receiving means disposed in said housing for receiving said plurality of **control signals** from the **aircraft fire control system**;

(iii) a microprocessor disposed in said housing;

iv) discrete **signal conditioning** means for filtering said discrete **signals** received from said **fire control system**; and

v) **simulation** means for substantially **simulating** a plurality of **missile interface response functions** of a **missile** in response to said plurality of **control signals**, said plurality of **missile interface functions** including a **missile release function**;

an umbilical interface for providing a data communication channel between said apparatus and said **fire control system** prior to a **simulated launch** of said **missile**;

an inert **missile body** adapted to be mounted to an **aircraft missile station**, said **missile body** having substantially equivalent physical dimensions and creating substantially equivalent static and aerodynamic load characteristics as an equivalent conventional **missile**

, said portable training module being disposed within said **missile** body;

a data link interface for providing a data communication channel between said apparatus and said fire **control system** subsequent to a **simulated** launch of said **missile**; and

a data link and data capture module for processing and recording data communications between said fire **control system** and said apparatus;

whereby said fire **control system** and said training module interchange information by coded **signals** for **testing** of said **missile** interface.
